THERMOSTAT LOCATION

Ideally, thermostats should be located within the room to be heated, subject to current electrical regulations relating to bathrooms and wet areas.

As the thermostat is floor sensing it can be installed out-side the room or in a cupboard if necessary.

For easy operation and access to controls choose a location about 1.3m above the floor.

Should a remote location for the thermostat be necessary, the system wiring can be extended up to 50m from the installation using 0.75mm twin core flex.

MAXIMUM LOAD

The 5259 can control underfloor heating systems of up to 16A or 3600W.

LARGE AREAS OVER 16A

For areas exceeding 16A that require control by a single thermostat, a contactor/snubber must be used.

Contactor/snubbers are available in our electrical accessories range.

Call 1300 368 631 for more information or visit www.thermogroup.com.au
